

FILAGO

The fallback system for the maternity ward

The „**electronic guard**“ for the maternity ward – a specialised system that provides an effective protection for the newborn baby against abduction and permutation.

Mother and child wear a light anti-allergic band with an integrated passive chip.

Every chip possesses an effective protection against sabotage and manipulation.

In order to assure a smooth integration of the system in the daily routine on the ward staff is equipped with a master chip.

Small discrete readers that identify the chip-code keep the entrance and exit doors of the ward under surveillance.

The alarm sets off when a baby-chip is identified without the presence of the mother or the master chip.

The alarm can take place visually, acoustically or through circuit entering and transmission onto existing systems (e.g. Nurse Call System)

The **Filago** - system offers several levels of protection that are adapted to the needs of the user and the local conditions (video recordings, automatic locking mechanism etc.).

Filago offers maximal protection for both mother and baby without restricting their freedom of movement. The chip is very comfortable to wear and it is also reusable. The data transfer does not represent any danger from the biological point of view.

Filago is a module of a main fallback system which could equally protect several other parts of the hospital. Modern electronics with CE-Certificate and little maintenance effort.
