

# FILAGO

## the security system for children

The children's ward is a very sensitive area in every hospital.

As well as being provided optimal medical care, children of all ages need to be supervised around the clock.

Curiosity, spontaneity or homesickness can lead children to leave the ward independently exposing themselves to additional risks.

**Filago** looks after every single child.

A light anti-allergic band with an integrated passive chip is worn around the wrist similar to wearing a watch.

Small discrete readers that identify the chip-code keep the entrance and exit doors of the ward under surveillance.

In case a child leaves the ward the chip is identified. The staff is instantly notified.

**Filago** allows the evaluation of the situation **at a glance** – clearly identifying **who** is leaving the ward and **where**.

The data transfer does not represent any harm from the biological point of view.

**Filago** operates wireless and involves very little constructional effort.

The chip is reusable and because it is comfortable to wear it is also very child-friendly.

**Filago** is a module of a main fallback system which could equally protect several other parts of the hospital. Modern electronics with CE-Certificate and little maintenance effort.
